BIST8130 - Final Proejct Codings

11/22/2021

```
library(tidyverse)
library(corrplot)
library(leaps)
library(performance)
library(MASS)
library(caret)

knitr::opts_chunk$set(
   fig.width = 8,
   fig.asp = .6,
   out.width = "90%",
   echo = TRUE, warning = FALSE, dpi=300

)
```

Step 1: Data Preprocessing

After importing the csv file containing the County Demographic Information (CDI) data, we notice that crimes, physicians, and hospital beds are given as numbers, while other info are given as proportions. We therefore compute the number of crimes, physicians, and hospital beds per 1000 people.

```
cdi_data = read_csv("./data/cdi.csv") %>%
  janitor::clean_names() %>%
  mutate(
    cty_state = str_c(cty,",",state),
    docs_rate_1000 = 1000 * docs/pop,
    # Compute number of doctors/hospital beds per 1000 people.
    beds_rate_1000 = 1000 * beds/pop,
    density = as.numeric(pop)/as.numeric(area),
    crime_rate_1000 = 1000 * crimes/pop) %>%
  # Compute number of crimes per 1000 people.
    dplyr::select(-docs,-beds,-crimes) %>%
    relocate(id,cty_state,cty)

#knitr::kable(head(cdi_data))
```

Step 2 - Exploratory Analysis

We then take a closer look of each variables, calculate the pairwise correlations between variables, and list all the correlations between the crime rate (our interest) and all other variables.

```
cdi_data_exp = cdi_data %>%
  dplyr::select(-id,-cty,-state, -cty_state)
par(mfrow=c(4,3))
boxplot(cdi_data_exp$area,main="Area")

```

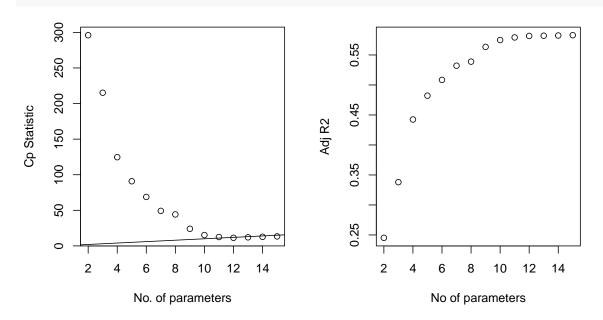

Figure 6: Subset selection for best parameter numbers

According to the output, we determine that the number of variables should be above 12 because $C_p \leq p$. Based on this analysis, we find that unemp could also be selected.

Discussion

We need to remove totaline, because it can be replaced. totaline = peincome * pop.

Model building from the vairables we selected

```
fit_nest = lm(crime_rate_1000 ~
                  pop + pop18 + bagrad +
                  poverty + unemp + pcincome + pcincome*pop + region +
                  beds_rate_1000 + density, data = cdi_model)
summary(fit_nest)

```

Figure 9: Diagnose plots of model without interaction terms

Compare to the diagnose plots of untransformed model, we found that the residuals are more unevenly distributed. Therefore, transformed model is worse. We select the untransformed model.

Our first model:

 $crime_rate_1000 = pop + pop18 + bagrad + poverty + unemp + pcincome + pcincome * pop + regionbeds_rate_1000 + pcincome + pcincome * pop + regionbeds_rate_1000 + pcincome + pcincome * pc$

Add Interaction term: poverty+income

According to Census Bureau, the number of persons below the official government poverty level was 33.6 million in 1990, representing 13.5 percent of the Nation's population. Thus, we can use

this criteria to divide **poverty** into two category: higher than national poverty rate and lower than national poverty rate.

```
poverty_status = cdi_model %>%
   mutate(national_poverty = if_else(poverty > 13.5, "higher", "lower"))

ggplot(poverty_status, aes(x = pcincome, y = crime_rate_1000, color = national_poverty)) +
   geom_point(alpha = .5) +
   geom_smooth(method = "lm", se = F, aes(group = national_poverty, color = national_poverty)) +
   labs(
        title = "Crime Rate and Per Capita Income by Poverty Status",
        x = "Per Capita Income",
        y = "Crime Rate ",
        color = "Comparison with national avergae"
   )
```

Crime Rate and Per Capita Income by Poverty Status

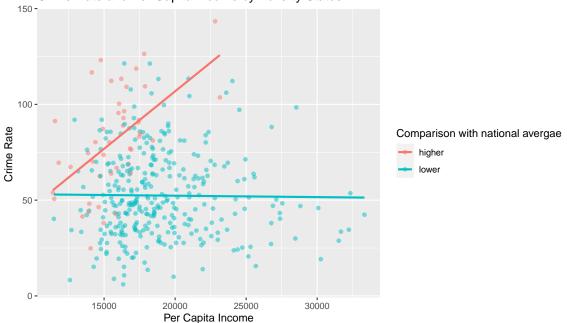

Figure 10: Interaction plot of Income Per Capita and Poverty

```
fit_int1 = lm(crime_rate_1000 ~
                  pop + pop18 + bagrad +

```

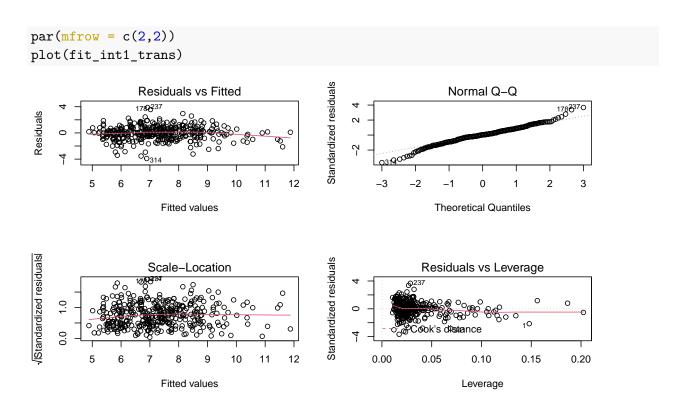

Figure 13: Diagnose plots with interaction terms:poverty*pcincome

Compare to the diagnose plots of untransformed model, we found that the residuals are more unevenly distributed. Therefore, transformed model is worse. We select the untransformed model.

Our second model:

 $crime_rate_1000 = pop + pop18 + poverty + unemp + pcincome + pcincome * pop + region + beds_rate_1000 + poverty + pcincome + pcinc$

Add interaction term: pcincome + bagrad

According to Census Bureau, national percent of persons 25 years old or older with bachelor's degrees is 20.8%. Thus, we can use this criteria to divide bagrad into two category: higher than national bagrad and lower than national bargrad.

```
bagrad_status = cdi_model %>%
  mutate(national_bagrad = if_else(bagrad > 20.8, "higher", "lower"))

ggplot(bagrad_status, aes(x = pcincome, y = crime_rate_1000, color = national_bagrad)) +
  geom_point(alpha = .5) +
  geom_smooth(method = "lm", se = F, aes(group = national_bagrad, color = national_bagrad)) +
  ylim(0,150) +
  labs(
    title = "Crime Rate and Per Capita Income by Percent Bachelor's Degrees Status",
    x = "Per Capita Income",
    y = "Crime Rate",
    color = "Comparison with national avergae"
)
```

Compare RMSE

Table 2: RMSE table for three models

model	RMSE	R_sq
1	16.01	0.576
2	15.48	0.603
3	15.92	0.582

The second model has the lowest RMSE.

Model Assessment on testing set

```
test_data = test_data %>%
  mutate(
    y = crime_rate_1000,
    y_model_1 = predict(model_train1,test_data),
    y_model_2 = predict(model_train2,test_data),
    y_model_3 = predict(model_train3,test_data))

RMSPE_1 = sqrt(mean((test_data$y-test_data$y_model_1)^2))

RMSPE_2 = sqrt(mean((test_data$y-test_data$y_model_2)^2))

RMSPE_3 = sqrt(mean((test_data$y-test_data$y_model_3)^2))

model_assessment = tibble(
    RMSPE_1 = round(RMSPE_1,2),
    RMSPE_2 = round(RMSPE_2,2),
```

Table 3: Model assessment table

Model	R_square	RMSE	RMSPE
1	0.576	16.01	14.79
2	0.603	15.48	15.04
3	0.582	15.92	14.94
